

## POPULATING PAGES

### Routes

```
<?php
use App\Http\Controllers\BooksController;
use Illuminate\Support\Facades\Route;
use App\Http\Controllers\HomeController;
use App\Http\Controllers\DashboardController;
use App\Http\Controllers\AuthController;
use App\Http\Controllers\LandingPageController;
```

```
Route::get(uri: '/', action: [LandingPageController::class, 'index'])->name(name: 'landing-page');
```

- ⇒ This route listens for a GET request to the root URL (/), and it triggers the **index** method of the **LandingPageController** to return the landing page view, which is also named landing-page for easy reference.

```
// Authentication Routes (only for guests)
Route::middleware(middleware: 'guest')->group(callback: function (): void {
    Route::get(uri: '/login', action: [AuthController::class, 'login'])->name(name: 'login');
    Route::post(uri: '/login', action: [AuthController::class, 'loginPost'])->name(name: 'login.post');
    Route::get(uri: '/register', action: [AuthController::class, 'register'])->name(name: 'register');
    Route::post(uri: '/register', action: [AuthController::class, 'registerPost'])->name(name: 'register.post');
});
```

- ⇒ This group handles login and registration routes for guests, protected by the **guest** middleware.
- ⇒ Only users who are **not logged in** can access these routes.

```
// Authenticated Routes (for logged-in users)
Route::middleware(middleware: 'auth')->group(callback: function (): void {
    Route::get(uri: '/contact', action: function (): Factory|View {
        return view(view: 'contact');
    });

    Route::get(uri: '/home', action: [HomeController::class, 'index'])->name(name: 'home.index');
    Route::get(uri: '/dashboard', action: [DashboardController::class, 'index'])->name(name: 'dashboard.show');

    Route::post(uri: '/logout', action: function (): Redirector|RedirectResponse {
        auth()->logout(); // Logs out the user
        return redirect(to: route(name: 'landing-page'));
    })->name(name: 'logout');

    // Content loading routes
    Route::get(uri: '/home/content', action: [BooksController::class, 'loadBooks'])->name(name: 'home.books');
    Route::get(uri: '/dashboard/content', action: [BooksController::class, 'loadBooks'])->name(name: 'dashboard.books');

    Route::get(uri: '/books/{id}', action: [BooksController::class, 'show'])->name(name: 'books.show');
});
```

- ⇒ This group handles routes for logged-in users, protected by the **auth** middleware.
- ⇒ Only **authenticated users** can access these routes.
- ⇒ Routes include viewing the contact page, home, and dashboard, loading book content, viewing book details, and logging out.

```
Route::get(uri: '/books/{id}', action: [BooksController::class, 'show'])->name(name: 'books.show');
```

- ⇒ This route handles requests to **view details of a specific book**.
- ⇒ The **{id}** in the URL is a dynamic parameter that represents the unique ID of the book.
- ⇒ When accessed, it calls the **show** method in the **BooksController**.
- ⇒ The route is named **books.show**, allowing easy reference in code.

## Controllers

### LandingPageController

```
2
3 namespace App\Http\Controllers;
4 use App\Http\Controllers\BooksController;
5 use Illuminate\Http\Request;
6 |
7 class LandingPageController extends Controller
8 {
9     1 reference | 0 overrides
10     public function index(): Factory|View
11     {
12         $contentController = new BooksController();
13         $posts = $contentController->loadBooks();
14
15         return view(view: 'landing-page', data: compact(var_name: 'posts'));
16     }
17 }
```

- ⇒ Handles the logic for displaying the landing page.
- ⇒ In the **index** method, it creates an instance of the **BooksController**, calls its **loadBooks** method to retrieve the book data, and then passes this data to the **landing-page** view using the compact function.

### HomeController

```
app > Http > Controllers > HomeController.php > HomeController
1 <?php
2
3 namespace App\Http\Controllers;
4 use App\Http\Controllers\BooksController;
5 use Illuminate\Http\Request;
6
7 class HomeController extends Controller
8 {
9     1 reference | 0 overrides
10     public function index(): Factory|View
11     {
12         $contentController = new BooksController();
13         $posts = $contentController->loadBooks();
14
15         return view(view: 'home', data: compact(var_name: 'posts'));
16     }
17 }
```

- ⇒ Similar with the LandingPageController, but here, it passes the data to the **home** view.

## BooksController

```
home.blade.php BooksController.php X book-details.blade.php
app > Http > Controllers > BooksController.php > BooksController > loadBooks()
1  <?php
2
3  namespace App\Http\Controllers;
4
5  use Illuminate\Http\Request;
6
7  9 references | 0 implementations
class BooksController extends Controller
8  {
9      5 references | 0 overrides
    public function loadBooks(): array
10     {
11         $posts = [

194                 'num_ratings' => 121212,
195                 'num_reviews' => 20212,
196                 'genres' => ['Romance', 'Mystery'],
197                 'comments' => [
198                     ['reader' => 'Renato Jr.',
199                     'text' => 'A sweet romance with an intriguing plot. Loved it!',
200                     'time' => '2 months ago']
201                 ]
202             ],
203         ];
204         return $posts;
205     }
```

```

210 public function show($id): Factory|View
211 {
212
213     $posts = $this->loadBooks();
214
215     $book = collect(value: $posts)->firstWhere(key: 'book_id', operator: $id);
216
217     if (!$book) {
218         abort(code: 404);
219     }
220
221     return view(view: 'book-details', data: compact(var_name: 'book'));
222
223 }
224
225 }

```

⇒ The **loadBooks()** method acts as a "mock database" for book information.

- It creates and returns a static array of books (**\$posts**) containing details like the book ID, title, author, rating, cover image, description, number of ratings, number of reviews, genres, and comments (including the reader's name, the comment text, and the time the comment was made).
- While it doesn't interact with an actual database, this function simulates **book data retrieval**, serving as a placeholder for future database integration.

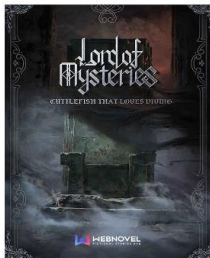

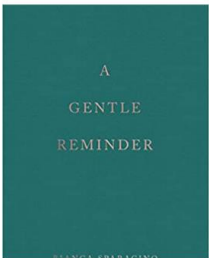

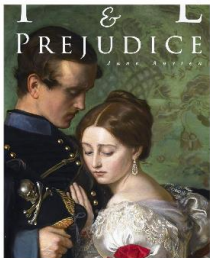

⇒ The **show()** method is responsible for displaying the **details of a specific book** based on its **ID**.

- It retrieves the list of books from the **loadBooks()** function and searches for a book that matches the provided ID using Laravel's **collect()->firstWhere()** method.
- If a matching book is found, its data is passed to the book-details view for rendering. If no book with the given ID exists, the function triggers a **404 error page**.

<section class="popular-now-section">
  <div class="container">
    <div class="d-flex justify-content-between align-items-center mb-4">
      <h3 class="text-left">Popular Now</h3>
      <a href="" class="view-all-link">View All</a>
    </div>

    <div class="row">
      @foreach (array_slice(array: $posts, offset: 0, length: 4) as $post)
        <div class="col-md-3 mb-4">
          <div class="card">
            <a href="{{ route('books.show', parameters: $post['book_id']) }}">
              
              <div class="card-body">
                <h5 class="book-title">{{ $post['title'] }}</h5>
                <h6 class="book-author">{{ $post['author'] }}</h6>
                <div class="star-rating">
                  @for ($i = 1; $i <= 5; $i++)
                    <i class="bi bi-star{{ $i <= $post['rating'] ? '-fill' : '' }}"></i>
                  @endfor
                </div>
                @foreach ($post['comments'] as $comment)
                  <div class="last-reader mt-3">
                    
                    <span class="reader"></span>
                    <span class="time">{{ $comment['time'] }}</span>
                  </div>
                @endforeach
              </div>
            </a>
          </div>
        </div>
      @endforeach
    </div>
  </div>
</section>
```

Displays the cover image of the book using the cover key from the \$post array.

Displays the title & author of the book from the \$post array.

Displays the rating of the book from the \$post array.

⇒ Previously, the book information was **hardcoded** but now it is retrieved **dynamically**.

⇒ To make it easier to handle and display, we used a **loop** to iterate through the data instead of manually writing each book's details.

```
@foreach (array_slice(array: $posts, offset: 0, length: 4) as $post)
```

⇒ This loops through the first 4 items in the **\$posts** array (using **array\_slice** to limit the number of items) and assigns each item to the variable **\$post**.

```
<a href="{{ route(name: 'books.show', parameters: $post['book_id']) }}">
```

⇒ This makes each book card clickable, and clicking it will navigate the user to the **details** page for that **specific book**, as defined in the **show()** method of the **BooksController**.

⇒ The **book\_id** ensures the correct book is displayed on the details page.

```
@for ($i = 1; $i <= 5; $i++)
    <i class="bi bi-star{{ $i <= $post['rating'] ? '-fill' : '' }}"></i>
@endfor
```

⇒ This loop **dynamically displays** filled or empty stars based on the **book's rating**.

- For each loop iteration, it checks if **\$i** (the current loop index) is less than or equal to the book's rating.
- If true, it adds the **-fill** class to make the star filled (representing a rating).
- If false, it leaves the star empty.

```
@foreach ($post['comments'] as $comment)
    <div class="last-reader mt-3">
        
        <span class="reader">{{ $comment['reader'] }}</span>
        <span class="time">{{ $comment['time'] }}</span>
    </div>
@endforeach
```

⇒ This code loops through each comment for the book and displays the profile picture, the reader's name, and the comment time for each comment.

⇒ All the data shown in the card are passed from the **\$posts** array in the **BooksController**.

```
69 <section class="latest-books-section">
70 <div class="container">
71 <div class="d-flex justify-content-between align-items-center mb-4">
72 <h3 class="text-left">Latest Books</h3>
73 <a href="" class="view-all-link">View All</a>
74 </div>
75
76 <div class="row">
77 @foreach (array_slice(array: $posts, offset: 4, length: 4) as $post)
78 <div class="col-md-3 mb-4">
79 <div class="card">
80 
81 <div class="card-body">
82 <h5 class="book-title">{{ $post['title'] }}</h5>
83 <h6 class="book-author">{{ $post['author'] }}</h6>
84 <div class="star-rating">
85 @for ($i = 1; $i <= 5; $i++)
86 <i class="bi bi-star{{ $i <= $post['rating'] ? '-fill' : '' }}"></i>
87 @endfor
88 </div>
89 @foreach ($post['comments'] as $comment)
90 <div class="last-reader mt-3">
91 
92 <span class="reader">{{ $comment['author'] }}</span>
93 <span class="time">{{ $comment['time'] }}</span>
94 </div>
95 @endforeach
96 </div>
97 </div>
98 </div>
99 @endforeach
100 </div>
101 </div>
102 </section>
```

⇒ Same goes for the latest- book-section.

### Omniscient Reader's Viewpoint

by Sing Shong

4.5 ★★★★★ 121,212 ratings • 20,212 reviews

Synopsis:

Only I know the end of this world. One day our MC finds himself stuck in the world of his favorite webnovel. What does he do to survive? It is a world struck by catastrophe and danger all around.

His edge? He knows the plot of the story to the end. Because he was the sole reader that stuck with it. Read his story to see how he survives!

Genres: Fantasy Manga Light Novel Science Fiction Manhwa Fiction

⇒ When a specific book is clicked, the user is redirected to the book's details page (**book-details.blade.php**) where information such as the book's title, author, rating, description, number of ratings, number of reviews, and genres are displayed.

- This is done using the route **books.show**, which passes the book's ID to the **show** method in **BooksController** to display the relevant details.

    }
});

```

⇒ Same goes for the Reviewed Books.

⇒ The **usort** function sorts the **\$posts** array in descending order based on the rating key, so books with higher ratings appear first.

## To Summarize:

- ⇒ **Authenticated users** can access the dashboard, home, and book details, as well as content loading and logging out.
- ⇒ **Non-authenticated users** can only access the landing page, login, and register routes.
- ⇒ The **BooksController** handles book-related data.
  - It has a method called **loadBooks()** that returns a **list of books** with details like title, author, rating, description, number of ratings, number of reviews, genres, and comments.
  - The **show()** method retrieves a **specific book's** information based on its **ID** and passes it to the **book-details.blade.php** view for display.
- ⇒ When the user visits the **home** page, a list of books is displayed.
  - The book data is fetched from the BooksController's loadBooks() method and passed to the home page view.
  - Users can click on a specific book to view its details.
- ⇒ When a **book is clicked**, the app redirects the user to the book's details page (book-details.blade.php).
  - The show() method in the BooksController is triggered with the book's ID.
  - The relevant book data is passed to the view, where details like the title, author, rating, description, number of ratings, number of reviews, genres, and comments are displayed.
- ⇒ As for the **dashboard**, the book data is also dynamically loaded and displayed, similar to the homepage.
  - The "View All" button shows the hidden remaining books and reviews (the rest of the books and reviews not initially displayed).
  - The "Show Less" button hides the extra books and reviews, returning the display to the limited initial set.
